homeomorphic \implies homotopic \implies homologous

Decidability in Algebraic Topology

- Are two groups isomorphic given their representations? **Undecidable**¹.
- Are two triangulations homeomorphic? **Undecidable**.
- Are two triangulations homotopic? **Undecidable**.
- Are two triangulations homologous? **Decidable**!

Introduction to Homology and Holes

1 Simplicial and Chain Complexes

2 Cycles and Boundaries

3 Holes and Homology

- 0-holes : connected components

Holes and Dimension

- 0-holes : connected components
- 1-holes : tunnels or handles

Holes and Dimension

- 0-holes : connected components
- 1-holes : tunnels or handles
- 2-holes : cavities

Simplices

Simplicial complexes

Simplices

Boundary of simplices

Simplicial complex - Definition

A simplicial complex K is a set of simplices satisfying the two following properties :

- the boundary of every simplex in K is also included in K .
- the intersection of two simplices of K is either empty, either exactly one common subface.

Examples of simplicial complexes

a. Game of Thrones Relationship Graph, by Kumar, Martinez, Wong, Zhao.

$$K : \quad C_n \xrightarrow{\partial_n} \dots \xrightarrow{\partial_{q+1}} C_q \xrightarrow{\partial_q} C_{q-1} \xrightarrow{\partial_{q-1}} \dots \xrightarrow{\partial_1} C_0 \xrightarrow{\partial_0} 0$$

$$K : \quad C_n \xrightarrow{\partial_n} \dots \xrightarrow{\partial_{q+1}} C_q \xrightarrow{\partial_q} C_{q-1} \xrightarrow{\partial_{q-1}} \dots \xrightarrow{\partial_1} C_0 \xrightarrow{\partial_0} 0$$

C_q : q -chains

C_q is a vector space called the q -chains.

∂_q : boundary operator

∂_q is a linear map from C_q to C_{q-1} that satisfies $\partial_{q+1} \circ \partial_q = 0$.
It is called the q -boundary operator.

Chain complex of a simplicial complex

$$K : \quad C_n \xrightarrow{\partial_n} \dots \xrightarrow{\partial_{q+1}} C_q \xrightarrow{\partial_q} C_{q-1} \xrightarrow{\partial_{q-1}} \dots \xrightarrow{\partial_1} C_0 \xrightarrow{\partial_0} 0$$

C_q : q -chains

C_q is a vector space called the q -chains.

C_q is the $\mathbb{Z}/2\mathbb{Z}$ vector space generated by the q -simplices.

∂_q : boundary operator

∂_q is a linear map from C_q to C_{q-1} that satisfies $\partial_{q+1} \circ \partial_q = 0$.
It is called the q -boundary operator.

∂_q is the map generated by the boundary of the q -simplices.

Concrete example

$K : \mathbb{Z}/2\mathbb{Z}$ -chain complex

- $C_0 = \text{span}(A, B, C, D)$
- $C_1 = \text{span}(f, g, h, i, j)$
- $C_2 = \text{span}(\Phi)$

Concrete example

$K : \mathbb{Z}/2\mathbb{Z}$ -chain complex

- $C_0 = \text{span}(A, B, C, D)$
- $C_1 = \text{span}(f, g, h, i, j)$
- $C_2 = \text{span}(\Phi)$

$$\partial_0 = \begin{array}{c} A \quad B \quad C \quad D \\ \begin{pmatrix} 0 & 0 & 0 & 0 \end{pmatrix} \end{array} \quad \partial_2 = \begin{array}{c} \Phi \\ \begin{pmatrix} 1 \\ 1 \\ 1 \\ 0 \\ 0 \end{pmatrix} \end{array} \begin{array}{c} f \\ g \\ h \\ i \\ j \end{array}$$

$$\partial_1 = \begin{array}{ccccc} f & g & h & i & j \\ \begin{pmatrix} 1 & 1 & 0 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 & 1 \\ 0 & 0 & 0 & 1 & 1 \end{pmatrix} & \begin{array}{c} A \\ B \\ C \\ D \end{array} \end{array}$$

Concrete example

$$x = f + h + j \in C_1$$

$$\begin{aligned}\partial_1(x) &= \partial_1(f + h + j) \\ &= (A + B) + (B + C) \\ &\quad + (C + D)\end{aligned}$$

$K : \mathbb{Z}/2\mathbb{Z}$ -chain complex

- $C_0 = \text{span}(A, B, C, D)$
- $C_1 = \text{span}(f, g, h, i, j)$
- $C_2 = \text{span}(\Phi)$

$$\partial_0 = \begin{pmatrix} A & B & C & D \\ 0 & 0 & 0 & 0 \end{pmatrix} \quad \partial_2 = \begin{pmatrix} \Phi \\ 1 \\ 1 \\ 1 \\ 0 \\ 0 \end{pmatrix} \begin{matrix} f \\ g \\ h \\ i \\ j \end{matrix}$$

$$\partial_1 = \begin{pmatrix} f & g & h & i & j \\ 1 & 1 & 0 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 & 1 \\ 0 & 0 & 0 & 1 & 1 \end{pmatrix} \begin{matrix} A \\ B \\ C \\ D \end{matrix}$$

Concrete example

$K : \mathbb{Z}/2\mathbb{Z}$ -chain complex

- $C_0 = \text{span}(A, B, C, D)$
- $C_1 = \text{span}(f, g, h, i, j)$
- $C_2 = \text{span}(\Phi)$

$$\partial_0 = \begin{pmatrix} A & B & C & D \\ 0 & 0 & 0 & 0 \end{pmatrix} \quad \partial_2 = \begin{pmatrix} \Phi \\ 1 \\ 1 \\ 1 \\ 0 \\ 0 \end{pmatrix} \begin{matrix} f \\ g \\ h \\ i \\ j \end{matrix}$$

$$\begin{aligned} x &= f + h + j \in C_1 \\ \partial_1(x) &= \partial_1(f + h + j) \\ &= (A + B) + (B + C) \\ &\quad + (C + D) \\ &= A + 2B + 2C + D \end{aligned}$$

$$\partial_1 = \begin{pmatrix} f & g & h & i & j \\ 1 & 1 & 0 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 & 1 \\ 0 & 0 & 0 & 1 & 1 \end{pmatrix} \begin{matrix} A \\ B \\ C \\ D \end{matrix}$$

Concrete example

$K : \mathbb{Z}/2\mathbb{Z}$ -chain complex

- $C_0 = \text{span}(A, B, C, D)$
- $C_1 = \text{span}(f, g, h, i, j)$
- $C_2 = \text{span}(\Phi)$

$$\partial_0 = \begin{array}{c} A \quad B \quad C \quad D \\ \begin{pmatrix} 0 & 0 & 0 & 0 \end{pmatrix} \end{array} \quad \partial_2 = \begin{array}{c} \Phi \\ \begin{pmatrix} 1 \\ 1 \\ 1 \\ 0 \\ 0 \end{pmatrix} \end{array} \begin{array}{c} f \\ g \\ h \\ i \\ j \end{array}$$

$$x = f + h + j \in C_1$$

$$\begin{aligned} \partial_1(x) &= \partial_1(f + h + j) \\ &= (A + B) + (B + C) \\ &\quad + (C + D) \end{aligned}$$

$$\partial_1(x) = A + D$$

$$\partial_1 = \begin{array}{c} f \quad g \quad h \quad i \quad j \\ \begin{pmatrix} 1 & 1 & 0 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 & 1 \\ 0 & 0 & 0 & 1 & 1 \end{pmatrix} \end{array} \begin{array}{c} A \\ B \\ C \\ D \end{array}$$

Boundary operator examples

Boundary operator examples

Boundary - Definition

A q -boundary is a q -chain that is the boundary of a $(q + 1)$ -chain.

$$q\text{-boundaries} = \text{im}(\partial_{q+1})$$

Boundary - Definition

A q -boundary is a q -chain that is the boundary of a $(q + 1)$ -chain.

$$q\text{-boundaries} = \text{im}(\partial_{q+1})$$

Boundary - Definition

A q -boundary is a q -chain that is the boundary of a $(q + 1)$ -chain.

$$q\text{-boundaries} = \text{im}(\partial_{q+1})$$

Boundary - Definition

A q -boundary is a q -chain that is the boundary of a $(q + 1)$ -chain.

$$q\text{-boundaries} = \text{im}(\partial_{q+1})$$

Non boundaries

Cycle - Definition

A q -cycle is a q -chain whose boundary is null.

$$q\text{-cycles} = \ker(\partial_q)$$

Cycle - Definition

A q -cycle is a q -chain whose boundary is null.

$$q\text{-cycles} = \ker(\partial_q)$$

Proposition

A **boundary** is a **cycle**.

Proposition

A **boundary** is a **cycle**.

$\partial_{q+1} \circ \partial_q = 0$, "a boundary has no boundary", $\text{im}(\partial_{q+1}) \subseteq \ker(\partial_q)$.

Cycles and Boundaries : Summary

Hole - Intuitive definition

A q -hole is a q -cycle that is not a q -boundary.

Holes and Homology

Hole - Intuitive definition

A q -hole is a q -cycle that is not a q -boundary.

Hole - Equivalence

Two q -holes are equivalent iff their difference is a q -boundary.

$$x \stackrel{q}{\sim} y \iff x - y \in \text{im}(\partial_{q+1})$$

Hole - Equivalence

Two q -holes are equivalent iff their difference is a q -boundary.

$$x \stackrel{q}{\sim} y \iff x - y \in \text{im}(\partial_{q+1})$$

Hole - Equivalence

Two q -holes are equivalent iff their difference is a q -boundary.

$$x \stackrel{q}{\sim} y \iff x - y \in \text{im}(\partial_{q+1})$$

Hole - Equivalence

Two q -holes are equivalent iff their difference is a q -boundary.

$$x \stackrel{q}{\sim} y \iff x - y \in \text{im}(\partial_{q+1})$$

Homology group - Definition

The equivalence classes of \sim^q form a group structure, called the **q -homology group** :

$$H_q(K) = \frac{\ker(\partial_q)}{\sim^q}$$

Homology group - Definition

The equivalence classes of \sim^q form a group structure, called the **q -homology group** :

$$H_q(K) = \frac{\ker(\partial_q)}{\sim^q} = \frac{\ker(\partial_q)}{\text{im}(\partial_{q+1})}$$

Homology group - Definition

The equivalence classes of \sim^q form a group structure, called the q -homology group :

$$H_q(K) = \frac{\ker(\partial_q)}{\sim^q} = \frac{\ker(\partial_q)}{\text{im}(\partial_{q+1})}$$

Betti numbers - Proposition

There exist a number β_q such that $H_q(K) \approx (\mathbb{Z}/2\mathbb{Z})^{\beta_q}$.

β_q is called the **Betti number** of dimension q and intuitively represent the number of holes of dimension q .

Clarification

$H_q(K) \approx (\mathbb{Z}/2\mathbb{Z})^{\beta_q}$: there are β_q holes and 2^{β_q} equivalence classes in $H_q(K)$. Each equivalence class represents a subset of holes.

Clarification

$H_q(K) \approx (\mathbb{Z}/2\mathbb{Z})^{\beta_q}$: there are β_q holes and 2^{β_q} equivalence classes in $H_q(K)$. Each equivalence class represents a subset of holes.

$$H_1(K) \approx (\mathbb{Z}/2\mathbb{Z})^2$$

Starting from a combinatorial/geometric structure (**simplicial complex**), we built an algebraic structure (**chain complex**) that allowed us to intuitively define **holes** and formally grasp **homology groups**.

Three approaches for computational homology :

Effective approach

Computation of reductions

$$\begin{array}{ccccccc}
 \cdots & \longrightarrow & C_{q+1} & \xrightleftharpoons[\textcolor{red}{h_q}]{\partial_{q+1}} & C_q & \longrightarrow & \cdots \\
 & & \textcolor{red}{g_{q+1}} \updownarrow & & \textcolor{red}{g_q} \updownarrow & & \\
 & & \textcolor{red}{f_{q+1}} \updownarrow & & \textcolor{red}{f_q} \updownarrow & & \\
 \cdots & \longrightarrow & C'_{q+1} & \xrightarrow{0} & C'_q & \longrightarrow & \cdots
 \end{array}$$

Combinatorial approach

Discrete Morse Theory

Algebraic approach

Smith Normal Form

$$\partial = P \begin{pmatrix} \alpha_1 & 0 & 0 & \cdots & 0 \\ 0 & \ddots & 0 & \cdots & 0 \\ 0 & 0 & \alpha_r & \cdots & 0 \\ \vdots & & & \ddots & \vdots \\ 0 & & \cdots & 0 & 0 \end{pmatrix} Q$$

where $\alpha_i \mid \alpha_{i+1}$.

To go further : Homology over a ring

Chain complex with a ring

If use \mathbb{Z} instead of $\mathbb{Z}/2\mathbb{Z}$, C_q is not anymore a vector space but a \mathbb{Z} -**module**. Weird things happen...

To go further : Homology over a ring

Chain complex with a ring

If use \mathbb{Z} instead of $\mathbb{Z}/2\mathbb{Z}$, C_q is not anymore a vector space but a \mathbb{Z} -**module**. Weird things happen...

Holes and torsion

$$H_q(K) \approx \underbrace{\mathbb{Z}^{\beta_q}}_{\text{holes}} \times \underbrace{\frac{\mathbb{Z}}{\alpha_1 \mathbb{Z}} \times \frac{\mathbb{Z}}{\alpha_2 \mathbb{Z}} \times \cdots \times \frac{\mathbb{Z}}{\alpha_m \mathbb{Z}}}_{\text{torsion}}$$

$$H_1(K) \approx \mathbb{Z} \times \mathbb{Z}/2\mathbb{Z}$$

The location of a hole : where intuition struggles

The location of a hole : where intuition struggles
